

## Soybean Varieties with Soybean Cyst Nematode Resistance

### Soybean Variety Listing

January 2009

This list was compiled for informational purposes only and is based on information provided by the seed companies. Attempts were made to include all appropriate resistant varieties. We do not warrant or guarantee the standard of any variety listed. Furthermore, no endorsement is intended of listed varieties, or is criticism implied of varieties not listed. Neither University of Illinois nor its' faculty or staff may be held responsible for damages resulting from use of this information.

This list of soybean varieties was compiled to benefit soybean producers who are in need of resistant soybeans to use in the management of a soybean cyst nematode (SCN) infestation.

Listed seed companies provided information from which this list was compiled. Company provided information concerning maturity and extent of SCN resistance has not been confirmed by University of Illinois research.

Sincere effort was expended to contact all companies offering SCN resistant soybean varieties for sale in the soybean growing states. It is acknowledged that some companies may have been overlooked in this effort. If such is the case, it was not intentional.

It is believed that all varieties listed will be available to producers to grow for the 2009 growing season. Unless otherwise noted, all privately marketed soybeans listed here are believed to be pure line varieties.

Varieties are listed in order by company code within Maturity Groups 0 to VIII. Company names and addresses, associated with codes provided under Company Code, are summarized at the end of this publication. Unless otherwise indicated, races to which varieties are listed resistant, is based on what might be called the 16 race Arkansas system of classification of race designation is used. Tolerant (T), Low Resistant (LR), Moderately Resistant (MR), Moderately Susceptible (MS), and Susceptible (S) are used to describe varietal reaction to races on which information is provided. NSG indicates (No Source Given).

Producers seeking seed of SCN resistant soybeans, should look within Maturity Groups most appropriate for their location. Performance information on some varieties included here can be found in annual reports of the Soybean Variety Testing Project, available from University of Illinois Extension. Producers are reminded that SCN resistant varieties need to be used in association with appropriate crop rotation schemes to effectively manage the SCN problem.

## Approximate Soybean Maturity Zones

The 10 maturity groups corresponding to horizontal bands across the United States. The soybean varieties that are best adapted to Illinois conditions are from Maturity Group II through Maturity Group V.
